

Ex No 3 Implement minimax algorithm

Code:

```
def minimax(depth, nodeIndex, isMax, scores, h):  
    if depth == h:  
        return scores[nodeIndex]  
  
    if isMax:  
        return max(minimax(depth + 1, nodeIndex * 2, False, scores, h), minimax(depth + 1, nodeIndex * 2 +  
1, False, scores, h))  
  
    else:  
        return min(minimax(depth + 1, nodeIndex * 2, True, scores, h), minimax(depth + 1, nodeIndex * 2 +  
1, True, scores, h))  
  
scores = [3, 5, 6, 9, 1, 2, 0, -1]  
  
h = 3  
  
print("Optimal value:", minimax(0, 0, True, scores, h))
```

Output:

```
Optimal value: 5
```
